CHAPTER ONE
INTRODUCTION

To be successful in competitive bidding strategy, a contractor needs to bid high enough to assure himself of a profit on each job, yet low enough to get the job. The main problem is that if a contractor bids high enough for a sure profit, he may be too high to get the job. But the only way to be sure of having the low bid is to bid below cost.

Under these conditions, a contractor is faced with two extremely unpleasant alternatives: (1) an excellent chance of making no profit with a low bid, or (2) no chance at all of making a high profit with a high bid. However, somewhere between these extremes there is an opportunity for a contractor to make a reasonable profit.

Every job has an optimum or "best bid" which will, in the long run, result in the highest possible profit obtainable under the existing competitive situation. The objective of a competitive bidding strategy is simply to identify this optimum markup for a job before it is bid, or better yet, before incurring the time and expense of preparing a detailed cost estimate.

This paper will strive to generally illustrate the strategic bidding by finding the optimum markups for bids, using the actual bid data obtained from Naval Facilities Engineering Command Contracts Office, Naval Air Station (NAS), Jacksonville, Florida.

The objectives of this paper also include a general introduction of strategy, the importance of it, and the practical analysis of actual bid data by strategic bidding.

The optimum markups computed based on the actual data in this paper, however, are solely to illustrate the bidding strategy, not to be used in practice, since the number of data utilized for analysis were not sufficient enough and also the data used for analysis were collected only from a single source.

CHAPTER TWO

STRATEGIC BIDDING

2.1 The Meaning of Strategy

Strategy can be defined in the following ways:

- Skillful management in getting the better of an adversary.
- The means by which a company uses its financial and physical resources to accomplish its objectives.
- The science and art of meeting competition under the most advantageous conditions possible.
- A careful plan or method.
- The art of devising or employing plans toward a goal.
- Management's ideas regarding a firm's objectives, the means by which these objectives will be accomplished, and the reasons for pursuing them.

In all cases, strategy involves management's decisions in the face of uncertain competition. A strategy is primarily concerned with attempting to meet this uncertain competition under favorable terms, ideally, in matching one's major strengths against the competitors' major weaknesses. Success in business requires certain general attributes on the part of management: a thorough understanding of the rules and conditions, a sound knowledge of the odds of the game, and a good sense for strategy.

2.2 The Role of Strategy

Strategy involves making competitive decisions; the more competitive an industry, the greater the need for making sound strategic decisions. Nowhere is this need greater than in construction contracting, where competitive pressures are probably more intense than in any other industry. Competitive bidding especially, offers abundant opportunities for the application of strategy. In competitive bidding the contractor is faced with two seemingly incompatible and contradictory objectives: He must bid high enough to make a profit, yet low enough to get a job-both at the same time.

Most contractors are able to estimate, at least with reasonable accuracy, what their direct costs on a job will be. And taking a single job, most of the competing contractors can also be expected to encounter roughly the same costs of performing the work; they are all subject to the same costs of operation, have access to the same labor supply, use the same types of equipment, obtain supplies and materials from the same sources, and have somewhat comparable, if not equal, supervisory capabilities.

However, some contractors are able to operate successful, profit-making business, while others go broke or are, at best, barely able to survive. The most difference between success and failure in the contracting business can be found in management's ability to make the strategic decision at the strategic time. Therefore, strategy is an essential ingredient for success in

every competitive situation.

2.3 The Management Decision

In contracting the area where profits must be made is the area between the estimated direct cost of doing a job and the amount bid for the job. The lower limit of a job's price—the actual—is more or less fixed, since there are few contractors who will willingly take a job at less than their direct cost.

The profit-making area between the estimated direct cost and the bid price is also the area where most losses are incurred. This is usually caused by either management's failure to include sufficient markup or its failure to attain sufficient volume to recover indirect costs. And it is therefore the management decision that brings the success or failure of business to nearly every construction firm.

Every important management decision involves a process of selection between two or more alternative courses of action; otherwise, no decision would be necessary. In making the best possible decision under the existing, known circumstances, several well-defined steps should be followed:

1. Define the objectives; what is hoped to be accomplished by the decision?
2. Identify different approaches that might be used to attain the desired objectives.
3. Analyze and compare these alternatives to see which offer the best possibilities.

4. Choose the approach that is best suited to the firm's capabilities and objectives.

The first step in developing a suitable competitive strategy is to determine the firm's objectives. These objectives can be expressed and measured in a number of different ways. Profit, probably the most common business objective, can be measured, for example, as a net dollar amount, or as a percentage return on sales, investment, net worth, assets, or working capital.

2.4 Measuring Bidding Efficiency

The major function of any executive is to make decisions. In general, the more difficult the decision, the greater the rewards for making the correct, or at least the best possible, decision. In order for the executive to be able to make effective decisions, he must first have alternatives to choose from, information (both factual and theoretical) on which to base his decision, and finally, the authority to act on his decisions once he has made them.

In contract construction, measuring bidding efficiency offers more bullets to decision makers and efficient bidding is obviously the key to success. Bidding efficiency is defined simply as the ratio of the amount of profit actually made, to the amount that could have been made had all competitors' bids been known prior to the letting.¹ In other words, it represents the

¹Park, William R, Construction Bidding for Profit, A Wiley-Interscience Publication, 1979

amount that could have been made by taking all jobs at the lowest competitors' price, providing the jobs would have been wanted at those prices.

2.4.1 Jobs in General

For illustration, the actual bid data from the contracting office at Naval Air Station (NAS),² Jacksonville, Florida were obtained. A typical data enclosed in Appendix A is shown in Table 1. These data include number of bidders, lowest bids, and

²Officer in Charge of Construction, Naval Facilities Engineering Command Contracts, Jacksonville, Florida

government estimates for various contracts awarded from November 1990 through April 1993.³

According to contracting officials at NAS, Jacksonville, these government estimates were prepared by adding the assumed contractors' profits and overheads to direct costs. These profits vary depending on the size of contract, ranging from 26 percent for contracts under \$100,000 to 16 percent for contracts above \$200,000. For jobs above \$100,000 and below \$200,000, 21 percent of profit was used and the overheads applied to all the government estimates were 19 percent.

Table 2. Summary of Direct Costs based on Government Estimates

Job Number	Gov Estimate	Direct Cost
1	675,979	500,725
2	330,899	245,110
3	233,000	172,593
4	267,876	198,427
5	149,000	106,429
6	497,000	368,148
7	294,400	218,074
8	185,448	132,463
9	110,000	78,571
10	170,100	121,500

Ten contracts were randomly selected from the list of data and analyzed for bidding efficiency. Table 2 shows the computed direct costs based on the government estimates. Since the direct

³Appendix A

costs on these jobs weren't available, the given percentages of the overheads and profits were used to calculate the direct costs. For example, the direct cost for the job number 1 is calculated as:

$$GOE = 1.35 \ DC$$

$$DC = \frac{GOE}{1.35} = 500,725$$

where GOE = the government estimate = 675,979

DC = the direct cost

$$1.35 = 100\% + 19\% + 16\%$$

Table 3 summarizes the results achieved by using the government estimates as assumed contractor's bids. Since this study is a simulation to obtain the optimum percentage markups

TABLE 3. Summary of Bid Tabulations on Ten Contracts

Job Number	Number of Competitors	Lowest Competitor's Bid	Assumed Bid	Maximum Profit Potential	Art's Assumed Profit
1	6	\$ 627,000	\$ 675,979	\$ 126,275	\$ 0
2	8	306,900	330,899	61,790	0
3	4	221,680	233,000	49,087	0
4	6	239,942	267,876	41,515	0
5	10	134,845	149,000	28,416	0
6	9	458,000	497,000	89,852	0
7	8	283,500	294,400	65,426	0
8	11	178,790	185,448	46,327	0
9	7	114,942	110,000	36,371	20,429
10	8	160,777	170,100	39,277	0
Total				\$584,336	\$20,429

for different job characteristics and most contractors can estimate, with reasonable accuracy, what their estimate will be on a job, an artificial company, 'Art Construction', who will use the assumed bids for this analysis, was created for the simulation.

In each case, the lowest competitor's bid on a job determines the maximum profit that can be made on that job, so the "maximum profit potential" represents the difference between the lowest competitor's bid and the estimated direct project cost.

Therefore, the maximum profit potential defines the most profit that could possibly have been made if all competitors' bids had been known in advance; for these ten jobs, then, the maximum profit potential was \$584,336.

The \$20,429 profit realized by Art Construction on job number nine represents 3.5 percent of his maximum profit potential on the ten jobs:

$$\frac{20,429}{584,336} = 0.035 = 3.5\%$$

Table 4 presents what the effect on this contractor's profits would have been had different markups been applied on the same ten jobs described in Table 3. The work was done using a spreadsheet computer software and the details are provided in Appendix B. Table 4 shows that the alternatives range from

Table 4. Results of Applying Various Percentage Markups to Bids

Markup Applied to Job (%)	Number of Jobs Won	Estimated Cost of Jobs Won	Gross Profit on Jobs Won	Bidding Efficiency (%)
0	10	2,549,027	0	0
1	10	2,570,448	21,420	3.7

11	4	715,791	60,567	10.4
12	3	435,620	39,904	6.8
13	3	438,945	43,229	7.4
15	2	282,786	31,655	5.4
20	1	109,214	15,714	2.7
25	1	113,143	19,643	3.4
28	0	0	0	0

getting all ten jobs at a 0 percent markup (no profit) to getting none of the jobs at a 26 percent markup (same result, no profit). Between these extremes, the choices will produce varying levels of profits ranging from \$12,571 at a 16 percent markup to \$97,181 at a 5 percent level. As the markup increases from zero, the volume of work decreases.

Eventually, profits increase to a maximum, then again decline to zero at the point of no volume. Figure 1 shows these relationships. Had all jobs been bid at a 5 percent markup, the contractor's bidding efficiency would have been:

$$\frac{97,181}{584,336} = 0.166 = 16.6\%$$

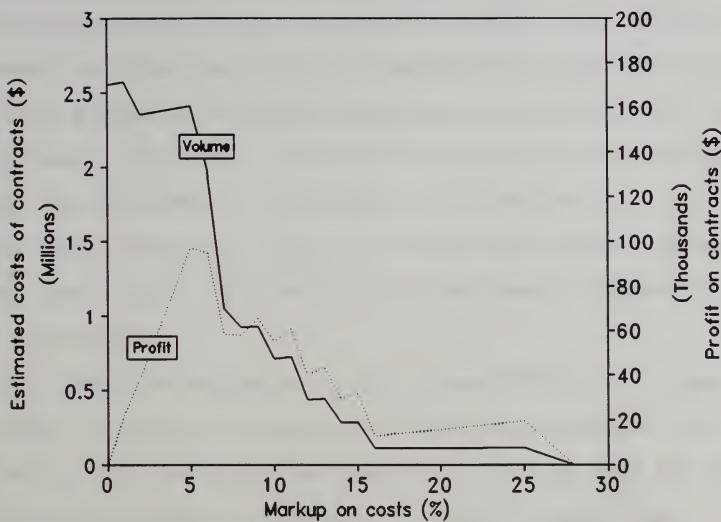

Figure 1. Profit and volume associated with different markups

2.4.2 Different Job Characteristics

By analyzing the bids on many more recent jobs (about 40 in this case) an effective bidding strategy was developed for this study. This bidding strategy identifies the markup to be used for different job sizes. Jobs are divided into three categories: 1) jobs over \$200,000, 2) jobs under \$200,000 and over \$100,000, 3) jobs under \$100,000. Again, this was done using a spreadsheet (QUATTRO PRO 4.0) and the details are enclosed in Appendix C, D, and E accordingly.

For contracts estimated at more than \$200,000, 13 jobs previously executed in Jacksonville area were selected and analyzed by applying different markups. The bid data for these 13 jobs are provided in Appendix F. Figure 2 shows the relationships of profit and volume associated with different

markups for these jobs. Applying various markups from 0 to 31 percent, the markup of 5 percent was found to be the optimum markup for these contracts priced at more than \$200,000. The bidding efficiency obtained from this

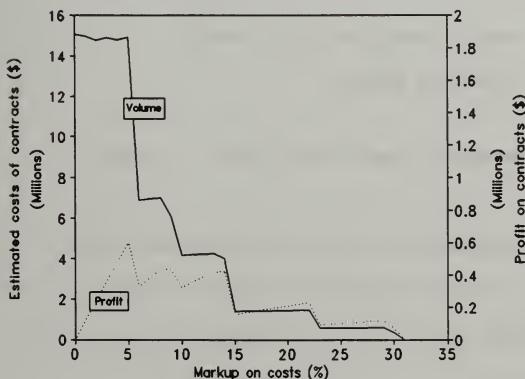

Figure 2. Profit and volume associated with different markups

optimum markup was 23.1 percent (see Appendix C for more detail).

For contracts estimated at more than \$100,000 and below \$200,000, 13 jobs were, again, selected and analyzed using the same method. The bid data are enclosed in Appendix G for reference. Figure 3 is a result of the analysis showing the optimum markup of 7 percent for the jobs at this level.

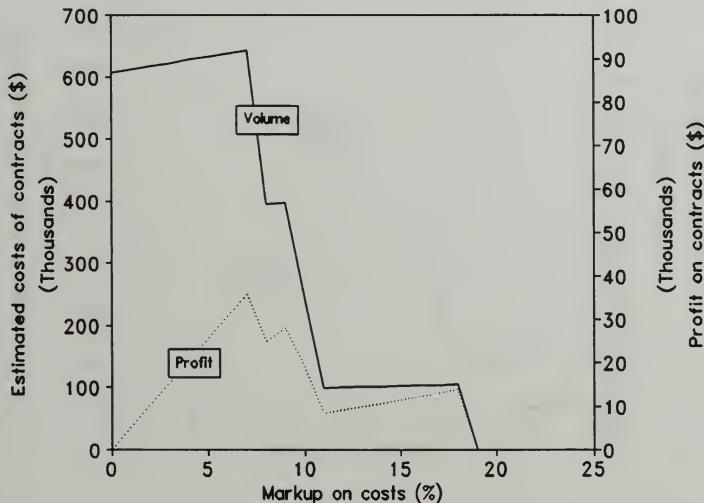

Figure 3. Profit and volume associated with different markups

The bidding efficiency calculated at the optimum markup was 10.4 percent. The markups applied for analysis ranged from 0 to 28 percent (see Appendix D for more detail).

Finally, 13 additional jobs were selected for contracts estimated at below \$100,000 and analyzed for strategic bidding. These bid data are enclosed in Appendix H. The optimum markup for bidding strategy at this level was 12 percent as shown in Figure 4.

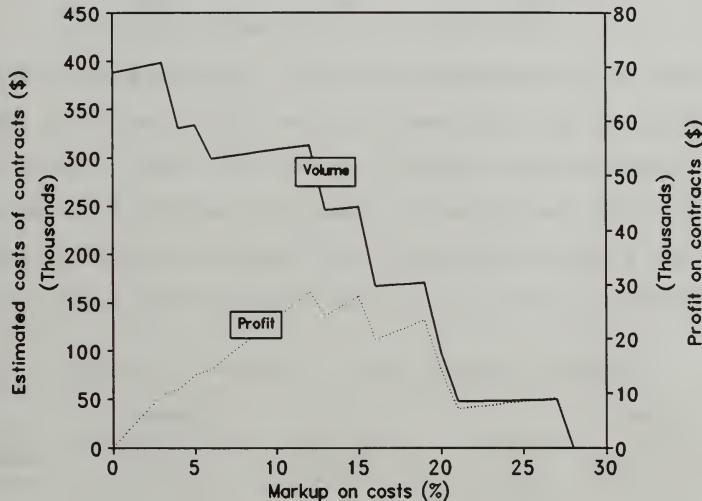

Figure 4. Profit and volume associated with different markups

The bidding efficiency, then, was calculated to be 17.1 percent and the markups applied for analysis ranged from 0 to 28 percent (Appendix E).

Combining these three analyses for different job characteristics, it was evident that the optimum markup for the jobs estimated at over \$200,000 was 5 percent, 7 percent for the

jobs estimated at over \$100,000 and under \$200,000, and 12 percent for the jobs estimated at below \$100,000 as shown in Table 5.

Table 5. Optimum Percentage Markups

Over \$200,000	\$100,000 to \$200,000	Under \$100,000
5%	7%	12%

This bidding strategy identifies the markup to be used for different job sizes. Were more data available for analysis, say several hundred jobs, the bidding strategy could be broken down in more detail including the number of competitors involved.

This particular strategy varies the markup from a low of 5 percent on large jobs bid to a high of 12 percent on small jobs

Table 6. Results of Using Optimum Markups

Job Number	Lowest Competitor's Bid	Optimum Markup (%)	Optimum Bid	Profit Using Optimum Bid
1	\$ 627,000	5	\$ 620,899	\$ 25,036
2	306,900	5	303,937	12,256
3	221,680	5	214,015	8,630
4	239,942	5	246,049	0
5	134,845	7	134,100	7,450
6	458,000	5	456,504	18,407
7	283,500	5	270,412	10,904
8	178,790	7	166,903	9,272
9	114,942	7	99,000	5,500
10	160,777	7	153,090	8,505
Total				105,960

bid. The results of applying this strategy to those same ten jobs in Table 3 for comparison is shown in Table 6. Earlier,

Table 3 showed that without bidding strategy the Art's profit would have been \$20,429 with 3.5 percent of the contractor's bidding efficiency. Applying the optimum markups obtained from the bidding strategy above, total profits of \$105,960 would have been realized on nine jobs. This profit is 9 percent more than would have been possible using any fixed markup (Table 4). This bidding strategy also raised the contractor's bidding efficiency to 18.1 percent.

CHAPTER THREE

CONCLUSION

Applying a carefully thought out bidding strategy and the selected strategy tailored to an individual contractor's specific operations can be quite important in achieving the maximum profit. Theoretically derived bidding strategies have proven effective in achieving the maximum profits possible under existing competitive conditions.

Therefore, the managers of any successful company should identify the markup that will result in the greatest possible profit on a specific job in view of the prevailing competitive situation surrounding that job and determine the chances of getting a job by bidding with the identified optimum markup.

A variable markup will almost invariably result in higher profits than any constant markup. Regardless of the strategy employed, it should be continually monitored by management, both to make sure the strategy is accomplishing its objectives and to make sure that the firm's objectives are reasonable in view of the existing competitive situation.

The overall effect of strategic bidding will raise the general level of industry profits by making individual contractors profit-conscious rather than volume conscious.
